

Basic workflow of Jira

Topic	Description	Key Points
JIRA	A project management and issue tracking tool used for bug tracking, project tracking, and Agile management.	Developed by Atlassian, widely used for Agile project management in software development, IT support, and business teams.
JIRA Interface Overview	The main components of JIRA's user interface.	Key sections include Dashboard, Projects, Issues, Boards, Reports, and Side Navigation Bar for quick access.
JIRA Dashboard	Central hub for project insights and issue tracking.	Customizable using gadgets like Issue Statistics, Sprint Health, and Assigned Issues for a quick project status overview.
Projects in JIRA	Organizes teams and tasks under a unified goal.	A project can be configured for Scrum, Kanban, or simple task management, with unique workflows, boards, and issue configurations.
Issue Types	Types of work items or tasks tracked in JIRA.	Common types: Story, Task, Bug, Epic, Sub-task. Helps categorize work into different work units.

Creating an Issue	Process of logging a task, bug, or feature request in JIRA.	Core unit of work in JIRA. Fields: Summary, Description, Assignee, Priority, Labels, etc.
Issue Fields	Data points used to describe and track issues.	Key fields: Summary, Assignee, Reporter, Priority, Labels, Components, and custom fields specific to the project.
JIRA Boards (Scrum/Kanban)	Visual tools for managing workflows.	Scrum Board is used for sprint-based planning; Kanban Board tracks tasks in a continuous flow.
Epics	Large bodies of work broken down into smaller tasks.	Represents a significant deliverable. Epics contain smaller issues such as stories or tasks to track long-term objectives.
Backlog	A prioritized list of all the tasks and issues that need to be done.	Issues in the backlog are not yet committed to a sprint or active development but can be ranked based on importance and urgency.
Sprints	Time-boxed work periods in Scrum methodology.	Typically lasts 1-4 weeks. Sprint planning, daily standups, sprint review, and retrospective are key events.
Components	Subsections or categories within a project.	Used to assign and organize issues to different parts of the project (e.g., "Frontend", "Backend", etc.).
Labels	Custom tags for organizing and filtering issues.	Can be added to issues to quickly identify certain themes (e.g., "bug", "urgent", "frontend").
Filters	Saved queries to find issues matching specific criteria.	Filters are reusable and can be shared. Basic searches use criteria like Assignee, Status, Priority.
JQL (JIRA Query Language)	A powerful search syntax for advanced issue querying.	Example query : <code>`status = "In Progress" AND assignee = "Anupam"`. Can be used for complex filtering and reporting.</code>
Subtasks	Smaller units of work within a larger task.	Breaks down large tasks into smaller, manageable units. Subtasks inherit properties from the parent task but can be worked on individually.
Assigning Issues	Allocating tasks to team members for resolution.	Assigning an issue defines who is responsible for its completion. Assignees can be changed based on workload and expertise.
Workflow	The set of steps an issue follows from creation to completion.	Statuses include Open, In Progress, Done. Workflows can be customized per project to reflect the team's process.
Workflow Transitions	Movement between different statuses in a workflow.	Defined transitions like "Start Progress", "Complete", or "Reopen". Custom transitions can be added.
Notifications	Automated messages about changes to issues.	Notification schemes define who gets notified about updates, transitions, comments, etc. Can notify assignees, watchers, and project owners.

Jira Board UI

Advantages of Jira

1. Integration is available in this Jira. That means the issue and project tracking software integrated with several third-parties Software's.
2. Jira is suitable for different types of users like developers, project managers, engineers, non-technical professionals and so on.
3. Supports the roadmap requirement.
4. Jira enables users to create any kind of issue.

Custom Fields	Additional fields tailored to a project's specific needs.	Examples: Severity, Impact, or Business Unit. Custom fields can be added to issues to capture unique information.
Versions/Releases	Represents a set of issues or features grouped for release.	Helps track the completion of issues assigned to a particular version. Can be used for release planning.
Time Tracking	Measure the time spent versus estimated time for tasks.	Tracks Original Estimate, Remaining Estimate, and Time Logged. Useful for monitoring team efficiency and resource allocation.
Worklogs	Logs the time team members spend working on specific tasks.	Provides visibility into how much effort was spent on individual tasks, and generates reports for tracking billable hours.
Timelines	A visual representation of long-term project progress.	Provides a view of epics, tasks, and their dependencies over time. Tracks overall progress towards project goals.
Burndown Chart	A graphical representation showing work remaining in a sprint.	Helps teams track progress within a sprint, aiming for a steady burn down to zero. Shows completed versus incomplete tasks.
Sprint Retrospective	A meeting at the end of a sprint to review performance and identify improvements.	Focuses on what went well and what could be improved. Can log action items in JIRA for future tracking.

Velocity Chart	Displays how much work was completed in previous sprints.	Useful for measuring the team's capacity and making future sprint predictions.
Cumulative Flow Diagram	Tracks the flow of work through different stages.	Highlights bottlenecks by showing the number of issues in each stage (e.g., To Do, In Progress, Done) over time.
Permission Schemes	Defines what actions users can perform on issues.	Controls who can view, create, edit, or delete issues. Assigns roles like Administrators, Developers, Testers, and Stakeholders.
Issue Linking	Connects related issues to show dependencies.	Common link types include "blocks", "relates to", and "duplicates". Helps track how tasks and bugs are related.
Issue Security Scheme	Limits visibility of issues to specific groups or roles.	Used for sensitive or confidential issues.
Issue Collector	Embeds a feedback form on a website to create issues directly in JIRA.	Great for collecting bug reports and feedback from users. Issues are automatically created in JIRA from form submissions.
Service Desk (ITSM)	A project type for managing IT and customer service requests.	Tailored for IT support teams, includes features like SLAs, queues, and customer portals.
SLA (Service Level Agreement)	Time-based metrics for resolving service desk issues.	SLAs ensure that issues are resolved within agreed timeframes. SLA breaches trigger notifications and escalations.
Tempo Timesheets	A JIRA add-on for tracking time, budgeting, and billing.	Allows teams to log work, manage budgets, and generate detailed reports for project costs and resource allocation.
Automation	Automates repetitive tasks based on rules and triggers.	Example: Automatically assign issues based on priority. Reduces manual effort in managing workflows and transitions.
Integrations	JIRA integrates with tools like Confluence, Bitbucket, Slack, Jenkins, and GitHub.	Facilitates collaboration and automation across development, documentation, and communication platforms.
Dependencies Management	Tracks relationships and dependencies between tasks.	Helps ensure tasks are completed in the right sequence, avoiding bottlenecks.
Advanced Timelines (Portfolio)	Provides a high-level view of multiple teams and projects.	Ideal for tracking complex projects and dependencies across teams. Provides resource allocation and long-term planning features.
Project Archiving	Archives completed or inactive projects to keep the system clutter-free.	Archived projects are not visible in the active project list but can be restored when needed.
Custom Dashboards	Personalized views of project data and metrics.	Widgets like Assigned to Me, Sprint Burndown, and Team Velocity provide visibility into project progress. Customizable for individual or team needs.
